

WHAT IS CLAIMED IS:

1. A system using a server to distribute an application to a client via a network, wherein a client transmits to said server a request to download an application including a platform type for said client and stores said application transmitted from said server in an application storage area;

said server comprising:

an application storage section comprising a prepared module group and a link information table storing link information for linking these modules as executable objects for respective platforms;

a download request acceptance section configured to accept a request to download said application from said client;

an application generation section configured to determine said platform type included in a download request accepted by said download request acceptance section, reference said link information table, and generate an executable object for said application; and

an application transmission section configured to transmit the executable object generated by said application generation section to said client.

2. A system using a server to distribute an application to a client via a network wherein a client transmits to said server a request to download an application and stores said application transmitted

from said server in an application storage area;

said server comprising:

an application storage section comprising a  
prepared module group and a link information table  
5 storing link information for linking these modules as  
executable objects for respective platforms;

a download request acceptance section configured  
to accept a request to download said application from  
said client;

10 an application generation section configured to  
determine a type of the platform based on a network  
address of said client, reference said link information  
table, and generate an executable object for said  
application; and

15 an application transmission section configured to  
transmit the executable object generated by said  
application generation section to said client.

3. A system using a server to distribute an  
application to a client via a network, wherein said  
20 client transmits to said server a request to download  
an application via a relay server and stores said  
application transmitted from said server in an  
application storage area;

said server comprising:

25 an application storage section comprising a  
prepared module group and a link information table  
storing link information for linking these modules as

executable objects for respective platforms;

a download request acceptance section configured to accept a request to download said application from said client;

5 an application generation section configured to determine a type of the platform based on a network address of said relay server, reference said link information table, and generate an executable object for said application; and

10 an application transmission section configured to transmit the executable object generated by said application generation section to said client.

4. A system using a server to distribute an application to a client via a network, wherein said client transmits to said server a request to download an application and stores the application transmitted from said server in an application storage area;

15 said server comprising:

an application storage section comprising a prepared module group and a link information table storing link information for linking these modules as executable objects for respective platforms;

20 a download request acceptance section having a plurality of port addresses configured to accept a request to download said application from said client;

25 an application generation section configured to determine a type of the platform based on a port

address having accepted said download request reference  
said link information table and generate an executable  
object for said application; and

5           an application transmission section configured to  
transmit the executable object generated by said  
application generation section to said client.

10           5. A system using a server to distribute an  
application to a client via a network wherein said  
client transmits to said server a request to download  
an application including a platform type for said  
client and stores said application transmitted from  
said server in an application storage area and said  
application comprises a first module group executed on  
said client and a second module group executed on said  
15       server in place of said client;

          said server comprising:

          an application storage section comprising said  
first and second module groups and a link information  
table storing link information configured to link these  
20       modules as executable objects for respective platforms;

          a download request acceptance section configured  
to accept a request to download an application from  
said client;

25           an application generation section configured to  
determine said platform type included in a download  
request accepted by said download request acceptance  
section, reference said link information table and

generate an executable object for said application;

an application transmission section configured to transmit the executable object generated by said application generation section to said client; and

5 a substitutive execution section configured to accept a processing request from said second module group executed on said server in place of said client during execution of an application on said client and transmit a substitutive execution result to said client.

10 6. A system using a server to distribute an application to a client via a network wherein said client transmits to said server a request to download an application and stores the application transmitted from said server in an application storage area and said application comprises a first module group executed on said client and a second module group executed on said server in place of said client;

said server comprising:

20 an application storage section comprising said first and second module groups and a link information table storing link information for linking these modules as executable objects for respective platforms;

25 a download request acceptance section configured to accept a request to download an application from said client;

an application generation section configured to

determine a type of the platform based on a network address of said client, reference said link information table, and generate an executable object for said application;

5           an application transmission section configured to transmit the executable object generated by said application generation section to said client; and

          a substitutive execution section configured to accept a processing request from said second module group executed on said server in place of said client during execution of an application on said client and sending a substitutive execution result to said client.

10           7. A system using a server to distribute an application to a client via a network wherein said client transmits to said server a request to download an application via a relay server and stores the application transmitted from said server in an application storage area and said application comprises a first module group executed on said client and a

15           second module group executed on said server in place of said client;

          said server comprising:

          an application storage section comprising said first and second module groups and a link information

20           table storing link information for linking these modules as executable objects for respective platforms;

25           a download request acceptance section configured

to accept a request to download an application from said client;

an application generation section configured to determine a type of the platform based on a network address of said relay server, referencing said link information table, and generating an executable object for said application;

an application transmission section configured to transmit the executable object generated by said application generation section to said client; and

a substitutive execution section configured to accept a processing request from said second module group executed on said server in place of said client during execution of an application on said client and transmit a substitutive execution result to said client.

8. A system using a server to distribute an application to a client via a network wherein said client transmits to said server a request to download an application and stores said application transmitted from said server in an application storage area said application comprises a first module group executed on said client and a second module group executed on said server in place of said client;

said server comprising:

an application storage section comprising said first and second module groups and a link information

table storing link information for linking these modules as executable objects for respective platforms;

a download request acceptance section having a plurality of port addresses configured to accept a

5 request to download an application from said client;

an application generation section configured to determine a type of the platform based on a port address having accepted said download request,

10 reference said link information table and generate an executable object for said application;

an application transmission section configured to transmit the executable object generated by said application generation section to said client; and

15 a substitutive execution section configured to accept a processing request from said second module group executed on said server in place of said client during execution of an application on said client and transmit a substitutive execution result to said client.

20 9. A system using a server to distribute an application to a client via a network wherein said client transmits to said server a download request including a function request of said application and stores said application transmitted from said server in  
25 an application storage area said application comprises a module group including modules having the same module interface and different functions;

said server comprising:

an application storage section comprising said module group and a link information table for linking these modules as executable objects compliant with an application function request from said client;

a download request acceptance section configured to accept a request to download said application from said client;

an application generation section configured to determine said application function request included in a download request accepted by said download request acceptance section, reference said link information table and generate an executable object for said application;

an application transmission section configured to transmit the executable object generated by said application generation section to a client.

10. A program for a computer to implement a function by which a client transmits to a server a request to download an application including a platform type for said client via a network and stores said application transmitted from said server in an application storage area, said function including:

a download request acceptance function configured to accept a request to download said application from said client;

an application generation function configured to

determine said platform type included in an accepted  
download request, reference a link information table  
storing link information for linking a prepared module  
group as an executable object for each platform, and  
5 generate an executable object for said application; and  
an application transmission function configured to  
transmit the generated executable object to said  
client.

11. A program for a computer to implement a  
10 function by which a client transmits to a server a  
request to download an application via a network and  
stores said application transmitted from said server in  
an application storage area, said function including:

a download request acceptance function configured  
15 to accept a request to download said application from  
said client;

an application generation function configured to  
determine a type of the platform based on a network  
address of said client, reference a link information  
20 table storing link information for linking a prepared  
module group as an executable object for each platform,  
and generate an executable object for said application;  
and

an application transmission function configured to  
25 transmit the generated executable object to said  
client.

12. A program for a computer to implement a

function by which a client transmits to a server a request to download an application via a relay server and stores said application transmitted from said server in an application storage area, said function including:

5 a download request acceptance function configured to accept a request to download said application from said client;

10 an application generation function configured to determine a type of the platform based on a network address of said relay server, reference a link information table storing link information for linking a prepared module group as an executable object for each platform, and generate an executable object for  
15 said application; and

an application transmission function configured to transmit a generated executable object to said client.

13. A program for a computer to implement a function by which a client transmits to a server a request to download an application via a network and stores said application transmitted from said server in an application storage area, said function including:

20 a download request acceptance function configured to accept a request to download said application from said client;

an application generation function configured to

determine a type of the platform based on a port address having accepted said download request, reference a link information table storing link information for linking a prepared module group as an executable object for each platform, and generate an executable object for said application; and an application transmission function configured to transmit the generated executable object to said client.

14. A program for a computer to implement a function by which a client transmits to a server a request to download an application including a platform type for said client and stores said application transmitted from said server in an application storage area, wherein

said application comprises a first module group executed on said client and a second module group executed on said server in place of said client; and

said function including:

a download request acceptance function configured to accept a request to download an application from said client;

an application generation function configured to determine said platform type included in an accepted download request, reference a link information table storing link information for linking said first and second module groups as executable objects for each

platform, and generate an executable object for said application;

an application transmission function configured to transmit the generated executable object to said client; and

a substitutive execution function configured to accept a processing request from said second module group executed on said server in place of said client during execution of an application on said client and transmit a substitutive execution result to said client.

15. A program for a computer to implement a function by which a client transmits to a server a request to download an application and stores said application transmitted from said server in an application storage area, wherein

said application comprises a first module group executed on said client and a second module group executed on said server in place of said client; and

said function including:

a download request acceptance function configured to accept a request to download an application from said client;

an application generation function configured to determine a type of the platform based on a network address of said client, reference a link information table storing link information for linking said first

and second module groups as executable objects for each platform, and generate an executable object for said application;

an application transmission function configured to  
5 transmit the generated executable object to said client; and

a substitutive execution function configured to  
accept a processing request from said second module  
group executed on said server in place of said client  
10 during execution of an application on said client and  
transmit a substitutive execution result to said client.

16. A program for a computer to implement a  
function by which a client transmits to a server a  
15 request to download an application via a relay server  
and stores said application transmitted from said  
server in an application storage area, wherein

said application comprises a first module group  
executed on said client and a second module group  
20 executed on said server in place of said client; and  
said function including:

a download request acceptance function configured  
to accept a request to download an application from  
said client;  
25 an application generation function configured to  
determine a type of the platform based on a network  
address of said relay server, reference a link

2025 RELEASE UNDER E.O. 14176

information table storing link information for linking said first and second module groups as executable objects for each platform, and generate an executable object for said application;

5           an application transmission function configured to transmit the generated executable object to said client; and

          a substitutive execution function configured to accept a processing request from said second module group executed on said server in place of said client during execution of an application on said client and transmit a substitutive execution result to said client.

10

17. A program for a computer to implement a function by which a client transmits to a server a request to download an application and stores said application transmitted from said server in an application storage area, wherein

15

said application comprises a first module group executed on said client and a second module group executed on said server in place of said client; and

20

said function including:

a download request acceptance function configured to accept a request to download an application from said client by using a plurality of port addresses;

25

an application generation function configured to determine a type of the platform based on a port

2025 RELEASE UNDER E.O. 14176

address having accepted said download request,  
reference a link information table storing link  
information for linking said first and second module  
groups as executable objects for each platform, and  
5 generate an executable object for said application;

an application transmission function configured to  
transmit the generated executable object to said  
client; and

10 a substitutive execution function configured to  
accept a processing request from said second module  
group executed on said server in place of said client  
during execution of an application on said client and  
transmit a substitutive execution result to said  
client.

15 18. A program for a computer to implement a  
function by which a client transmits to a server a  
download request including a function request of said  
application via a network and stores an application  
sent from said server in an application storage area,  
20 wherein

said application comprises a module group  
including modules having the same module interface and  
different functions; and

said function comprising:  
25 a download request acceptance function configured  
to accept a request to download said application from  
said client;

an application generation function configured to determine an application function request included in an accepted download request, reference said link information table, and generate an executable object for said application; and

5       an application transmission function configured to transmit the generated executable object to a client.
